

# Enterprise Financial Platforms at BNY

Leading UX for enterprise-grade B2B financial platforms used by internal teams and enterprise clients.

---

## ROLE

Senior UX Designer  
(Contract)

## TIMELINE

Sep 2022 – Jun 2023

## INDUSTRY

Financial Services

---

01

## Context

BNY's internal and client-facing tools spanned multiple B2B financial platforms, each with its own navigation, dashboard and workflow conventions. Product managers, business analysts and engineering needed a faster, more consistent way to design and ship features.

02

## The Challenge

Navigation, dashboards and workflows had grown inconsistently across the platform, and there was no unified design library to draw from — every new feature

risked reinventing patterns that already existed elsewhere in the product.

03

## Research

Worked closely with product managers, business analysts and engineering to understand where technical and business goals weren't yet aligned with user needs, and audited existing tools to find where a unified design library could remove the most friction.

Stakeholder workshops

Design audits

Usability reviews

Cross-team interviews

04

## Insights

The key findings that shaped the direction.

01

### **Complexity was often unnecessary, not inherent**

Many multi-step flows and financial concepts could be simplified for internal teams and enterprise clients without losing the underlying capability.

02

### **A unified library paid for itself quickly**

Once a shared design library existed for internal tools, delivery velocity and consistency both improved, because teams stopped rebuilding the same patterns.

03

### **Mentorship compounds design maturity**

Investing time in mentoring junior designers and improving documentation practices raised the baseline quality of work across the wider team, not just individual projects.

05

## **Design Strategy**

How decisions were made.

01

### **Simplify before you systemise**

Started by simplifying complex financial concepts and multi-step flows, making sure the underlying task was as clear as possible before turning it into a reusable pattern.

02

### **Build the library where the pain was worst**

Prioritised the internal tools and products causing the most duplicated design effort, to get delivery velocity gains early.

03

## Align technical and business goals

Worked directly with product managers, BAs and engineering so the design library reflected both business priorities and technical reality, not just visual preference.

04

## Raise the floor through mentorship

Mentored junior UX designers and improved documentation practices using Figma best practices, so design maturity kept improving after the initial library shipped.

06

## Solution

A unified design library for BNY's internal tools and products, paired with simplified navigation, dashboards and workflows across enterprise-grade B2B financial platforms.

- ✓ A unified design library adopted across internal tools, increasing delivery velocity
- ✓ Simplified multi-step financial workflows made accessible to internal teams and enterprise clients
- ✓ A mentorship and documentation practice that raised design maturity across the team

## Design System Thinking

This project wasn't designed as a one-off — here's how it connects back to the system.

### Components

A unified set of components for internal financial tools, replacing duplicated, platform-specific patterns.

### Tokens

Consistent visual foundations applied across navigation, dashboards and workflow screens.

### Patterns

Simplified patterns for multi-step financial flows, designed to be accessible to both internal teams and enterprise clients.

### Governance

Documentation practices and mentoring that kept design maturity improving after the library's initial release.

## Impact

Delivery velocity and consistency improved across internal tools once the unified design library was in place, and complex financial workflows became more accessible to both internal teams and enterprise clients.

## Reflection

This contract confirmed something I keep relearning: in finance, the fastest way to improve delivery speed is almost never 'work faster' — it's removing the duplicated effort caused by not having a shared library in the first place.
