Public Sector Digital Services at Marston

Designing and scaling internal-facing B2B digital services for public sector caseworkers and administrators.

ROLE

Senior Experience Designer

TIMELINE

Nov 2023 – Mar 2025

INDUSTRY

Public Sector

01

Context

Marston Holdings delivers services on behalf of public sector clients, with internal-facing tools used daily by caseworkers and administrative staff. As part of a large-scale transformation programme, the organisation needed to modernise these services for a mix of technical and non-technical users.

02

The Challenge

Caseworkers and administrative users were working with dashboards and services that hadn't kept pace with the scale of the transformation programme, increasing

effort for day-to-day tasks. Design and development also lacked a shared component library, slowing handoff and creating visual inconsistency across services.

03

Research

Ran research and co-creation workshops directly with caseworkers, administrative users and stakeholders to validate assumptions before committing to a direction, and embedded design QA reviews across the team to catch accessibility and consistency issues early.

Co-creation workshops

Stakeholder interviews

Usability reviews

Design QA audits

04

Insights

The key findings that shaped the direction.

01

Effort, not just usability, was the real metric

The biggest wins came from reducing the number of steps and amount of manual effort required from caseworkers, not just polishing individual screens.

02

A shared library changes the conversation with engineering

Once a governed Figma component library existed, design-to-dev handoff conversations shifted from 'how do I build this' to 'which variant do I use.'

03

Non-technical stakeholders needed a seat at the table early

Involving non-technical audiences in co-creation workshops early avoided costly rework later in the transformation programme.

05

Design Strategy

How decisions were made.

01

Understand the caseworker's day

Spent time understanding how caseworkers and administrative users actually moved through their daily tasks before proposing any redesign.

02

Build the library alongside the services

Developed the Figma component library in parallel with live service work, so it was shaped by real screens rather than designed in the abstract.

03

Co-create, don't just consult

Ran workshops with users and stakeholders as genuine co-creation sessions, using them to validate direction before investing in detailed design.

04

Embed QA into the process

Built design QA checkpoints into the team's workflow so accessibility and UI consistency were caught before release, not after.

06

Solution

A set of redesigned internal-facing services built around caseworker effort and administrative accuracy, backed by a governed Figma component library that sped up design-to-dev handoff across the transformation programme.

✓ Redesigned dashboards and workflows that reduced effort for caseworkers and administrative users

✓ A governed, tailored Figma component library adopted across the B2B application suite

- ✓ An embedded design QA process aligning teams on quality, accessibility and UI standards

07

Design System Thinking

This project wasn't designed as a one-off — here's how it connects back to the system.

Components

A B2B-focused Figma component library built specifically for the demands of internal case-management and administrative tooling.

Tokens

Shared visual foundations that kept dashboards and services consistent across a growing service portfolio.

Patterns

Reusable dashboard and workflow patterns that reduced effort for caseworkers doing repetitive, high-volume tasks.

Governance

A design QA process embedded across the team, aligning contributors on quality, accessibility and UI standards before release.

08

Impact

The transformation programme shipped with a governed component library in place, faster design-to-dev handoff, and services that reduced effort for the caseworkers and administrators who use them daily.

09

Reflection

Public sector work sharpened my sense that 'usability' is often really about effort — every unnecessary click is effort a caseworker has to spend hundreds of times a day. Building the component library alongside live service work, rather than upfront and in the abstract, kept it honest.
