B2B IoT Support Platform at Sweepr

Turning raw IoT device data into actionable, human-readable dashboards for a B2B customer-support platform.

ROLE

Senior Product Designer

TIMELINE

Mar 2021 – Sep 2022

INDUSTRY

IoT / Digital Support

01

Context

Sweepr builds a digital support platform that uses AI and machine learning to automate customer service for service providers, including major UK ISPs. The core design challenge was turning dense, technical device data into something a support agent or end customer could actually act on.

02

The Challenge

Device-level data from customer hardware was technically rich but not human-readable, making it hard for support teams and end users to diagnose issues quickly.

The platform also needed to work consistently across web portals and native mobile apps, for a distributed, cross-functional remote team.

03

Research

Ran research directly with clients and end users to understand what 'actionable' actually meant to them, and used heuristic and expert reviews to find where the existing designs were creating friction rather than clarity.

Client interviews

Heuristic reviews

Qualitative & quantitative research

Dovetail synthesis

04

Insights

The key findings that shaped the direction.

01

'Human-readable' had to be defined per audience

A support agent and an end customer needed very different levels of detail from the same underlying device data.

02

Design system gaps cost more on a distributed team

Working with a remote, cross-functional team across time zones made an early, deliberate design system decision far more valuable than it would be for a co-located team.

03

MVP clarity reduced iteration cycles

Getting explicit alignment on MVP scope with product and engineering leads noticeably reduced the number of design iterations needed per feature.

05

Design Strategy

How decisions were made.

01

Start with stakeholder goals

Spent time in-depth with stakeholders understanding both the business goals behind the platform and the real needs of support teams and end users.

02

Design a system, not a screen

Built the information architecture and visual design system from scratch, so consistency held across web portals and native mobile apps from day one.

03

Review before you redesign

Used heuristic and expert reviews to identify specific usability issues in existing flows before committing design effort to a new direction.

04

Streamline for a remote team

Clarified MVP requirements directly with product and engineering leads to reduce iteration cycles across a distributed, remote-first team.

06

Solution

A design system and set of dashboards that transformed technical IoT device data into actionable, human-readable views for support teams and end customers, consistent across web and mobile.

- ✓ A design system spanning web portals and native mobile apps
- ✓ Dashboards translating raw device data into actionable views for support and end users
- ✓ Streamlined agile practices that reduced iteration cycles across a remote team

Design System Thinking

This project wasn't designed as a one-off — here's how it connects back to the system.

Components

A component set built for data-dense dashboards, shared across the web portal and mobile apps.

Tokens

Visual foundations aligned to Sweepr's brand guidelines, applied consistently across every client-facing surface.

Patterns

Patterns for turning raw device data into actionable, human-readable views for two very different audiences.

Governance

Close collaboration with product and engineering leads to keep MVP scope and design decisions aligned across a remote team.

Impact

The platform gave support teams and end users a consistent, actionable way to understand device data across web and mobile, and directly shaped roadmap priorities through the research carried out with clients and users.

2

Platforms unified: web & mobile

UK ISPs

Enterprise clients supported

Remote

Cross-functional team

09

Reflection

Sweeprr taught me that 'actionable' is doing a lot of work in any IoT or data-heavy product – it means something different to every audience, and the design system has to hold multiple levels of detail without duplicating effort to maintain them.
